ABSTRACT

In conjunction with the Minnesota Office of Statewide Educational Assessment, the Bloomington Public Schools conducted an assessment of progress within the district. This report, prepared for dissemination to the school board, school staff and interested citizens, summarizes the results of the local assessment. Data concerning the achievement of 9-, 13-, and 17-year old students is included. Achievement of Bloomington students is compared with that reported for the entire state, the U.S., and for similar suburban communities both within the state and across the country. The interaction of achievement with student characteristics is also examined. Data collected were compared with a criterion determined by teachers' assessment of the importance of objectives (items). Using this criterion, a committee of teachers judged the assessment results as indicative of strength, potential strength, acceptability, potential need or need. Clusters of objectives, items of special interest, and detailed data are included in the volume. (SD)

COMINGTON MATHEMATICS ASSESSMENT

EXECUTIVE SUMMARY

INTRODUCTION

This report describes the mathematics performance of Bloomington 9, 13, and 17-year-old students in an assessment of mathematics conducted in coop-. eration with the Minnesota Department of Education. Strengths and weaknesses of the mathematics performance are reviewed and serve as the basis for the recommendations and conclusions of this report.

This summary briefly describes the findings of this assessment. The concerns and recommendations expressed are those of the mathematics analysis committee. The complete report gives more specific information and provides the basis for this summary.

The assessment required the cooperation and support of all building principals and teachers to accomplish the necessary testing. Staff members also were involved in developing ratings of expected performance and analyzing results. These persons participated:

The Bloomington Assessment was directed by Dr. Donald Weiss and by Orville Ruud. The overall State Assessment program is under the direction of Dr. John Adams. Dr. Rosemary Schneiderhan provided our district with liason advice and worked with us through the rating and analysis activities.

The total State Assessment Staff supported this activity. The State Assessment staff includes:

Dr. John Adams

Director

Office of Statewide Educational Assessment

Dr. Rosemary Schneiderhan Coordinator Office of Statewide Educational Assessment Dr. William McMillan Supervisor, Instrumentation & Development Office of Statewide Educational Assessment

SCORING, DATA ANALYSIS AND REPORTING

All open-ended exercises were scored by National Computer Systems, Minneapolis, Minnesota, by coding student responses into several categories of correct and incorrect responses to allow for diagnosis of the types of errors made by seventeen-year-olds. A raw data tape was then created of all responses from student questionnaires, student performance bookfets, school questionnaires and district questionnaires.

Triangle Research Associates edited the statewide tape, built the data analysis file and produced the output necessary for data analysis. TIES Research Division produced the output for Bloomington's results.

The Office of Statewide Educational Assessment analyzed the state data and prepared the written reports of the state results.

Orville Ruud and Dr. Rosemary Schneiderhan prepared written reports of the results of Bloomington student performance. Leacher members of the analysis and reporting committee wrote statements of overall results, concerns and recommendations.

Shirley Mansur and Dorothy Gardner of the Elementary Division Office and District Evaluation Office organized and typed the report for printing.

FURTHER ASSESSMENT,

Bloomington Relative Assessment For Public Reporting is supported through the existance of a District Evaluation Advisory Committee which has the specific tasks of recommendations to the Superintendent of Schools:

(1) Areas for district evaluation

(2) Strategies for district evaluation

(3) Position statements and descriptions of the overall structure and purpose of evaluation through the district.

Recommendations of the Evaluation Advisory Committee are channeled to the District Administrative Advisory Committee and the Superintendent's cabinet.

A description of this District Evaluation Advisory Committee is found in Appendix 1.1.

OVERALL RESULTS

The assessment established that Bloomington students have good computation skills, mathematical concepts and facility in problem solving. (The 17-year-old age group had the least exemplary performance.

Bloomington students performed well in the assessment as judged against the performance of others and the expectation of their teachers.

Performance of Bloomington 9 and 13-year-olds consistently equaled or exceeded the performance of their counterparts across the state and across the nation. Performance of Bloomington 17-year-olds was less exemplary, most often equaling but not often exceeding, the performance of their counterparts across the state.

Bloomington teachers expect high performance from their students. Against these teacher standards Bloomington students at all levels have some areas for improvement.

Assessment results supporting these statements came from analysis of student performance at each level (9, 13 and 17-year-olds) according to student achievement within:

- (1) Approximately 66 specific objectives of mathematics instruction.
- (2) 10 to 15 clusters of mathematics content.
- (3) Test questions also used in the national assessment.
- (4) Different types of students (i.e. boys/girls) likes or dislikes math.
- (5) Comparisons of achievement of 9, 13 and 17-year-olds on the same items.
- 1. Achievement of the objectives of mathematics instruction
 - (1) Teacher Criteria

In contrast to the performance levels expected by their teachers, Bloomington student performance was judged acceptable (meeting expectations) or strong (exceeding expectations) on the following per cent of objectives of instruction.

9-Year-Olds	<u> </u>			13-Year-Olds		17-Year-Olds
51%	•	••	**	58%	,	67%

(2) Comparison To State

In contrast to statewide ferformance, Bloomington student performance was judged acceptable (meeting state performance) or strong (exceeding by over 2% state performance) on the following percentage of objectives of instruction.

9-Year-Olds		13-Year-Olds	17-Year-Olds
96%	•	86%	93%

. 2. Performance by clusters of mathematics content.

Performance in clusters representing general mathematics content (e.g. computation skills, measurement, geometry, etc.) equalled or surpassed the performance of students across the state in the following per cent of these clusters.

9-Year-Olds	,	_	13-Year-01ds		•	γ. <u>17</u> -	-Year-01	ds
100%	,		93%	ı		, it	80%	

3. Comparison of Bloomington performance with the state and nation.

. Certain test questions that had been used by national assessment allowed this comparison with national results.

Comparative Bloomington Performance by % of items

		Bloomington Significantly Allove*	· No Piffcrence	Bloomington Significantly, Below *
Bloomington vs Minnesota	.9, 13 ,17	38.7 38.8 7.3	58.1 57.4 83.6	3.2 3.7 9.1
Bloomington vs Minnesota Suburbs	9 13 17	29.0 24.0 0.0	61.3 70.3 81.8	9.7 5.5 18.2
Bloomington vs U.S.	9 13 17	71.0 68.5 29.1	22.5 29.6 65:4	6.5 1.8 5.5
Bloomington vs U.S. Suburbs	9 13 17	29.0 29.6 14.6	64.5 68.5 83.6	6.5 1.8 1.8

^{*} Not attributable to chance in 95/100 cases.

- 4. Performance by student characteristics
- (1) Performance of Bloomington girls and boys was the same at all three age levels. (Statewide performance indicated that girls outperformed boys at ages nine and thirteen, while boys outperformed girls at age seventeen.)
- (2) Bloomington students liking mathematics significantly outperformed Bloomington students not liking mathematics.
- (3) High S.E.S. (soció-economic status) students performed best and low S.E.S. students performed lowest at all three age levels.
- (4) At age seventeen, the number of years that students were enrolled in mathematics classes was directly proportional to better mathematics performance. (Students with more years outperform students with fewer years.)
- (5) Enrollment in vocational/technical courses was not related to mathematics performance.
- 5. Comparison of 9, 13 and 17-year-olds growth of achievement

To measure growth in mathematics skills and understanding between the ages 9, 13 and 17-year-olds, some identical questions were used in testing each age level. Bloomington 9, 13 and 17-year-olds do demonstrate growth in performance. The largest gains are in the areas of multiplication, division, word problems, geometry and algebra. Interestingly 13-year-olds outperform 17-year-olds on metrics.

Bloomington performance growth between 9 and 13-year-olds consistently exceeds that of statewide students but the performance growth between 13 and 17-year-olds does not keep pace.

CONCERNS

Although the overall performance of Bloomington students is commendable, certain specific concerns exist including:

- (1) Subtraction with borrowing possibly is not being mastered by 9-year-olds and 9-year-olds are frequently unable to recognize equivalent mathematics statements. These are indicated as topics to be taught at this level in the scope and sequence.
- (2) Even though by state standards only 3.7% of the 13-year-old objectives analyzed are recognized as needing instructional attention, Bloomington staff members have identified 14 objectives in basic skills areas as probably needing instructional emphasis. On these objectives, listed in Chapter II, section 2.3, students did not perform above the 50% level expected.
- (3) Bloomington 17-year-olds lack sufficient high school mathematics instruction as evidenced by appendix 3.3 comparison of 17-year-olds performance with Minnesota suburbs.
- (4) Student mathematics performance shows a general decrease between ages 13 and 17 as reported in Chapter V, section 5.3.

- (5) 17-year-olds show needs in consumer mathematics topics in the performance on objectives as reported in Chapter II.
- (6) Bloomington performance in metrics although commendable by state standards should be improved to meet student needs today.

RECOMMENDATIONS

- (1) Bloomington students, elementary and secondary mathematics teachers, administrative staff and our past mathematics coordinator should be commended for the excellent mathematics program.
- (2) Review and update of the mathematics scope and sequence should be initiated.
- (3) Consideration should be given to the idea of establishing a pregraduation competancy based examination designed to encourage continued mathematical education and insure acceptable consumer mathematical functioning.
 - (4) Consider requirement of layear of mathematics after junior, high.
- (5) A follow up assessment of mathematics should be conducted each four years from now on.
 - (6) Monies should be set aside to implement these recommendations.

· CHAPTER I

THE BLOOMINGTON ASSESSMENT PROGRAM

1.1 Background and Purpose

. Background

Bloomington Relative Assessment forms a part of an overall design for evaluation. This conditment to evaluation was made by School Board action. ρ

MINUTES OF THE REGULAR MEETING OF THE BOARD OF EDUCATION
INDEPENDENT SCHOOL DISTRICT NO. 271
Bloomington, Minnesota

September 17,1974 -

VI. DISTRICT EVALUATION

Hilborn MOVED, Allen seconded, approval for the district to piggyback on state wide assessment in mathematics and test the Iowa Test of Basic Skills on a sample basis in grades three and six and report results to the Board; and that the administration develop a program of assessment of classroom instruction. Passed unanimously.

For 1974-75 participation in a "piggy back" evalution of Bloomington mathematics within the state mathematics assessment was viewed as a means of accomplishing part of the relative assessment desired. Dr. Donald Weiss, Director of Data Processing and Evaluation, acted under the direction of the school board and superintendent to contract with the state assessment office for Bloomington participation. In January 1975, Orville Ruud, acting Director of Evaluation, assumed responsibility for completion of the piggy back mathematics assessment.

The activities comprising the mathematics assessment occurred in this sequence within Bloomington and the state:

Purpose

The objective of relative assessment is to give a measure of how well overall our curriculum is doing in relationship to the expectations of others for that curriculum. The District Position Statement on Evaluation describes how this assessment relates to other evaluation.

POSITION STATEMENT

The purpose of evaluation is to prepare factual information to assist those responsible for decision-making in the Bloomington Public Schools. Evaluation is to be accomplished in the following areas:

District Relative Assessment for Public Reporting Building Program Evaluation
Classroom Instructional Evaluation

The province of Relative Assessment is that of the Superintendent, the Assistant Superintendent in charge of Elementary Education, the Assistant Superintendent in charge of Secondary Education. Each assistant superintendent reports on division results to the Superintendent. The Superintendent is responsible for reporting the overall results to the Board of Education, who, as a group represents the public. The Superintendent is concerned with making decisions on the allocation of funds to set priorities based upon total curriculum needs, division needs, and/or program needs relative to the overall needs of the district curriculum, and to the generally accepted goals of the schools in the region, the state, and the nation. The assistant superintendent is concerned with making decisions on the allocation of funds between buildings and to set priorities based on instructional needs of the division and the buildings to implement curriculum.

The province of Program Evaluation is that of the assistant superintendent and the principal within the building. The assistant superintendent is responsible for directing the principal's development, of program evaluation, monitoring the process of program evaluation and reviewing the use of the program evaluation outcomes and decisions. Results are reported to the assistant superintendent in charge, the teachers in the building, and the parents in the attendance area. The principal obtains information through program evaluation for decision-making relating to personnel assignment, space needs, materials, time allocation and budget development. The principal is concerned with decisions to set priorities to improve and maintain building programs of instruction.

The province of Instructional Evaluation is that of the principal and the teacher. The principal is responsible for directing the teacher's development of instructional evaluation and reviewing the use of instructional evaluation. The teacher is concerned with decisions to set priorities to accomplish and improve instruction. The teacher obtains information through instructional evaluation of how instruction is meeting the needs of the students. Results are reported to students, parents and the principal. From instructional evaluation the teacher decided appropriate content, media, sequence, activities and student groupings for each student. The teacher also obtains information from instructional evaluation on the overall effectiveness of the instruction for decision-making regarding teaching strategy, materials, and time allocations.

1.2 Design and Implementation of Bloomington Mathematics Assessment

The design of Bloomington Mathematics Assessment was to "piggy-back" on the comprehensive activities of state wide assessment. This required, within Bloomington, extending of the number of students tested and utilizing working groups of teaching staff for rating and analysis activities. Instrumentation and sampling for the assessment was provided from the state assessment office. The instrumentation required definition of objectives, writing of exercise packets, development of student questionnaires and the development of school questionnaires.

INSTRUMENTATION

1. Objectives: Initial objective development activities for mathematics assessment were undertaken in 1972 in conjuction with pilot phase activities of the Minnesota Educational Assessment Program. This pilot phase focused on grades three and six. Final sets of objectives for assessment of nine, thirteen and seventeen-year-olds were completed during the fall of 1973. The development of all objectives involved input from educators in higher education and public and private schools as well as from professional organizations and lay persons.

The structure of objectives remained consistent across ages, with emphasis given to appropriate age categories. Each set of objectives was written to cover six cognitive levels. The six cognitive levels were:

1. Recall and Recognition

2. Performing Mathematical Manipulations

3. Understanding Mathematical Concepts and Processes

4. Problem Solving

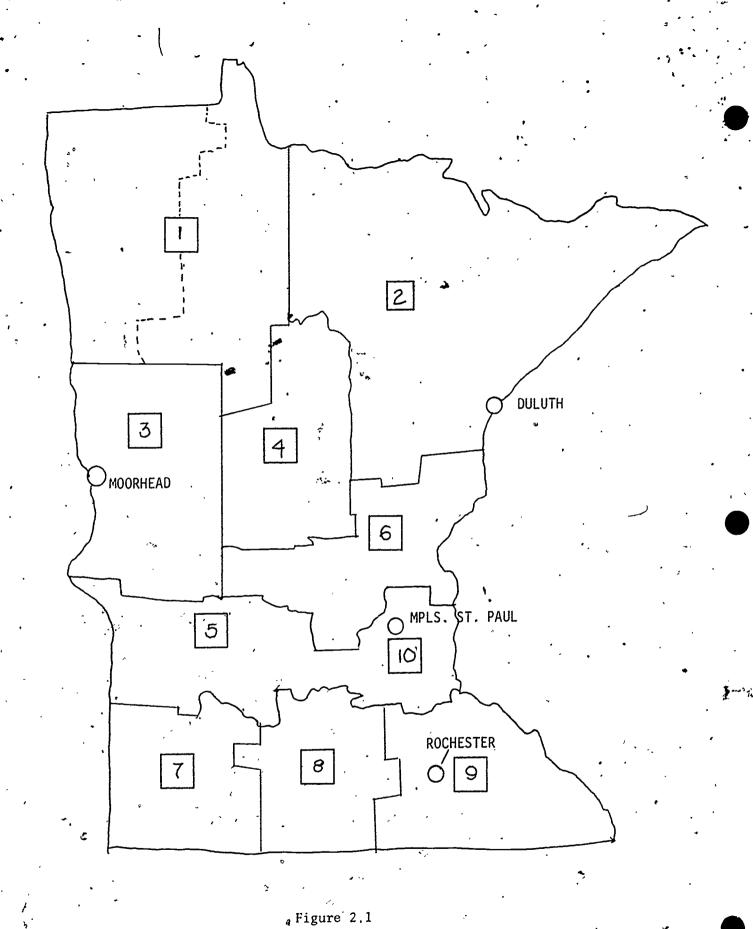

- 5. Analyzing Problem Situations
- 6. Appreciation
- 2. Exercise Packages: A team of six mathematics educators developed exercises based upon objectives to be measured. Judy Halvorson, Kennedy and Dr. Louis Cohen, Jefferson were part of this writing team. Content validity of exercises was established by another group of mathematics educators. Exercises were screened and then field tested with approximately 250 students for each age. group in twelve schools representing large city, suburban and rural districts in the winter of 1975. Based upon field test results, a total of 210 performance exercises were divided into three approximately parallel packages requiring a total administration time of 100 minutes per package. In addition, three appreciation level exercises were included in each package. A total of fiftysix exercises were taken from National Assessment to provide a basis for comparison with national results on these exercises. Seventy percent of the exercises were multiple choice items and thirty percent were open-ended.

- 3. Student Questionnaires: The last six pages of each exercise package contained twenty-three questions which requested information from students related to the following kinds of variables: (1) grade, (2) sex, (3) racial background, (4) home and family background characteristics, (5) general attitudes toward school and mathematics, (6) participation in school programs, (7) mathematics materials used in instruction, (8) educational aspirations and (9) information concerning parental education and occupation.
- 4. School Questionnaires: Each school participating in the mathematics assessment provided information for each of the following classes of variables related to that school: (1) size and type of community, (2) socioeconomic characteristics of the school population, (3) characteristics of mathematics programs within the school, and (4) ratings of the adequacy of facilities, materials, and professional and supportive staff.

This data allows Bloomington comparison with similar district performance.

SAMPLE DESIGN

- 1. Statewide Sampling: A two stage stratified sampling design was used to select random samples of approximately 5,000 pupils for statewide testing for each of the packages, of mathematics exercises used. The schools to be tested were selected in the first stage. The second phase was the random selected schools. The sample designs for the 9, 13, and 17-year-old groups had these characteristics:
 - (1) A random sample of students was drawn from each population; viz. of nine-year-old pupils, born between January 1 and December 31, of 1965; of thirteen-year-old pupils, born between January 1 and December 31 of 1961; and of seventeen-year-old pupils, born between October 1, 1957 and September 30, 1958.
 - (2) Each of the geographical reporting regions of the state (see Figure 1.1) was represented in the sample so that the results could be reported for each of them with statistical precision. These reporting regions are consistent with the Governor's planning regions, with the exception that Region 1 and 2 were combined to form Assessment Region 1.
 - (3) A matrix sampling approach was developed to shorten the length of individual student testing time. Each student selected in the sample took one of the exercise books of the mathematics exercises.
 - (4) Length of the assessment session for each student did not exceed two hours.

THE TEN ASSESSMENT REGIONS OF MINNESOTA

2. Bloomington Sampling: A random sample of pupils was drawn from the entire student population: The size of this sample was intended to allow generalization of results to the level where district performance would be assessed. Matrix sample design was used so that each student took only part of the total test package.

DATA COLLECTION

1. Statewide,

The mathematics exercises of statewide assessment were administrated by a team of forty trained exercise administrators. Paced-tape recordings were used to standardize the administration of (1) directions given to students and (2) the time allotted for each exercise.

Table 1.1 '
STATEWIDE MATHEMATICS ASSESSMENT

SCORING, DATA ANALYSIS AND REPORTING

All open-ended exercises were scored by National Computer Systems, Minneapolis, Minnesota, by coding student responses into several categories of correct and incorrect responses to allow for diagnosis of the types of errors made by seventeen-year-olds. A raw data tape was then created of all responses from student questionnaires, student performance booklets, school questionnaires and district questionnaires.

Triangle Research Associates edited the statewide tape, built the data analysis file and produced the output necessary for data analysis. TIES Research Division produced the output for Bloomington's results.

The Office of Statewide Educational Assessment analyzed the state data and prepared the written reports of the state results.

Orville Ruud and Dr. Rosemary Schneiderhan prepared written reports of the results of Bloomington student performance. Teacher members of the analysis and reporting committee wrote statements of overall results, concerns and recommendations.

ANALYSIS OF MATHEMATICS PERFORMANCE BY OBJECTIVES IN COMPARISON TO TEACHER STANDARDS AND IN COMPARISON TO OTHER MINNESOTA STUDENTS

2.1 The Analysis Process

Results in this chapter will be reported by student performance on objectives, i.e. the number of objectives where student performance rated strong; the number where it rated weak.

Interpretation Committee Classification Procedure

A committee of Bloomington teachers provided a judgment concerning the strength or need of instructional practices based upon student performance on each objective as compared to:

- (1) The criteria of teacher rating of desired performance (Criterion measure)
- (2) The performance of other Minnesota students (Normative measure)

Student performance on each objective was judged to fall into one of the following classifications:

(1) Strength

(4) Potential Need

(2) Potential Strength

(5) Need

(3) Acceptable

Approximately a 2% difference was used as a guideline to judge a strength comparison to statewide performance.

2.2 Student Performance by Objectives .- Nine-Year-Olds

Summary of Student Performance by Objectives .

Table 2.1 below gives a breakdown of the number and percentage of objectives by performance level.

CLASSIFICATION OF PERFORMANCE ON OBJECTIVES FOR NINESYEAR-OLDS

	Teacher	Criteria	Comparison	to Statewide Performance
Classification	Number of Objectives	Percent of, All Objectives	Number of Objectives	Percent of . All Objectives
Strength	14	21	مثله 32	48
Potential Strength	. 6	9 ′	1	2
Acceptable	14	. 21	-31	47
Potential Need	· 7	11	0	0
Need	25	³ _38	. 3	. 4
TOTALS	6 6	100	66	. 101

As can be seen in the preceeding table, performance levels for . 9-year-old pupils on 34 of the 66; objectives by teacher criteria measure and 63 of the 66 objectives by comparative measure were judged as acceptable or above.

Performance levels on 32 of the objectives by teacher criteria measure and 3 of the objectives by comparative measure were judged as representing a potential need or a need.

A complete rating of performance is found in the appendix.

Of special interest are the objectives judged as indicating strength on both criteria and comparative measure and the 3 objectives representing need on both comparative and criteria measure. These objectives and representative items are presented on the next pages as special strengths and special needs. The performance percentages are those for the item examples.

Performance percentages for the objective categories are in appendix 2.1, 2.2 and 2.3.

SPECIAL STRENGTHS - NINE-YEAR-OLDS

- 9. At the start of their trip the odometer on the Smith's car looked like this 07654. At the end of the trip it looked like this 01717171. How many miles did they travel?
 - O 321
 - ()654 ·
 - 777 -
 - \bigcap 123
 - O I don't know.

IIL2 The student will demonstrate competency in performing mathematical manipulations by reading a matrix or table.

BLOOMINGTON PERFORMANCE	TEACHER MINIMUM CRITERIA	<u> </u>	STATE PERFORMANCE	·
82.3	60		78.5	

11. In the table to the right, which shape is in row B, column 3?

Bloomington 9-year-olds outperform state 9-year-olds in every group of skills, including what the populace generally would consider basic skills. Whereas 96% of the objectives were identified as being at or above an acceptable level, only 4% were identified as needing additional attention. Bloomington 9-year-olds do significantly better, compared to criterion and comparative measures, in the following related objectives-properties of addition, mathematical symbols, concept of odd and even, simple subtraction, ordinal numbers and the 0 principles. The assessment results demonstrated the breadth of the Bloomington mathematics program through significant performance superiority in areas not considered basic to all programs, such as use of a matrix, using concepts of set theory and applying probability theory.

In relation to these same measures, Bloomington teachers recognize that at this age, their students do not perform in an acceptable manner in subtraction involving regrouping (borrowing) and in recognizing equivalent statements.

Even though, by state standards, only 4% of the objectives analyzed are recognized as needing instructional attention, Bloomington staff members have identified these additional 28 objectives as needing increased instructional emphasis because student performance on these objectives did not meet the performance level they expected.

43. Which chart shows part of the graph of the equation x = y?

The comparison of Bloomington 13-year-olds performance with the performance of 13-year-olds in similar districts in Minnesota shows that of the 67 comparison objectives analyzed, Bloomington 13-year-olds scored significantly above their counterparts in 28% of these objectives and significantly below on 6% of these objectives. Overall, Bloomington student performance significantly exceeded that of their suburban counterparts.

Statewide results showed a greater difference in performance of Bloomington 13-year-olds. They out-performed their counterparts in 39% of the 67 comparison objectives, and fell below on only 3% of the objectives. The performance of Bloomington students significantly exceeded that of their statewide counterparts.

Even though by state standards only 3% of the 13-year-old objectives analyzed are recognized as needing instructional attention, Bloomington staff members identified these 14 objectives as probably needing instructional emphasis. These objectives were rated as important objectives and student performance on these objectives did not meet the minimum performance level expected by teachers.

- Recognize diameter, radius and circumference of a circle.(IC3)
- Knowledge of metric prefixes kilo, hecto, deca, centi, milli, deci. (ID2)

42. A man bought two pounds of cheese in eight—ounce packages. How many packages did he buy?

SEVENTEEN-YEAR-OLD PERFORMANCE SUMMARY

Data on the student performance by objectives for 17-year-olds indicates a good overall performance.

Seventy-seven percent of the criterion established by district mathematics instructors, were met or exceeded by this group. Even though this is a good performance on district objectives, twenty-three percent of these objectives demonstrate less than acceptable performance.

Comparing Bloomington students to students across the state also reflects a high performance. Bloomington students ranked lower on only four objectives. These four objectives are: (1) knowledge of the metric system, (2) solving consumer type problems, (3) ratio and percent and (4) locating a flaw in an algebraic proof.

2.5 SUMMARÝ FOR NINE, THIRTEEN AND SEVENTEEN-YEAR-OLD PERFORMANCE

The performance of Bloomington students within objectives of the mathematics assessment was commendable. By every measure and at every age they had good performance.

The assessment results demonstrated the breadth of the Bloomington mathematics curriculum by the performance superiority students exhibited in areas not considered basic to all programs.

The expectations of Bloomington teachers for mathematics achievement are high. Student performance judged against teacher expectations does suggest areas for improvement.

Objectives where need was judged by both teacher criteria and comparison with performance of other students were for nine-year-olds:

- Subtraction with borrowing and recognizing equivalent statements.

thirteen-year-olds:

- Rounding off numbers to the nearest tenth, hundred or thousand, recognizing the graph of linear equations.

seventeen-year-olds:

- Knowledge of the metric system, solving consumer type problems and locating a flaw in an algebraic proof.

A complete table of student performance by objectives is in appendix 2.1, 2.2 and 2.3

CHAPTER III

ANALYSIS OF MATHEMATICS PERFORMANCE CONTENT BY CLUSTERS AND IN CONTRAST TO GHARACTERISTICS OF STUDENTS . . .

B.1 Introduction

Clusters were developed to classify exercises in terms of content areas and operations across objectives. The definitions and general content incorporated in each cluster are described below for each level.

NINE-YEAR-OLD CLUSTERS (10)

- C1: COMPUTATION WITH WHOLE NUMBERS: Recall of basic facts and computation (addition, subtraction, multiplication and division) involving up to three digit numbers.
- 2: MATHEMATICAL CONCEPTS AND PROCESSES: Recognition of number properties and operations, the number line, and order relationships.
- P1: PROPERTIES OF NUMBERS: Place value, naming numbers (numerals) counting, odd and even numbers.
- S1: MATHEMATICAL SYMBOLS AND SETS: Order relationships between numbers and concepts related to sets.
- F1: INTRODUCTION TO FRACTIONS: Recognizing the meaning of fractional parts and order among fractions.
- G1: <u>RECOGNITION OF GEOMETRIC-PROPERTIES</u>: Names and properties of geometric figures, including open and closed curves, lines, and symmetry.
- G2: APPLICATIONS OF GEOMETRIC PROPERTIES: Geometri€ concepts such as length, area and volume are applied to a variety of problem settings.
- M1: MEASUREMENT: Recognition of appropriate units of measure for a given situation and applications of measurement systems (Metric, English).
- PS1: BASIC PROBLEM SOLVING: Translating verbal statement or representations into math statements.
- PS2: LOGIC, EQUATIONS, PATTERNS, GRAPHS, PROBABILITY AND ADVANCED PROBLEM SOLVING: An introduction to logical reasoning, solving simple equations, recognitions of mathematics patterns and graphs. Includes basic ideas of probability and advanced problem solving situations.

THIPTEEN-YFAR-OLD CLUSTERS (15)

- C1: Computation With Whole Numbers: Recall of basic facts and computation with up to four place numbers using addition, subtraction, multiplication and division.
- C2: Concepts and Computation With Common Fractions: The operations of addition, subtraction, multiplication and division are applied to common fractions.

 Also included is the recognition of fractional comparisons including ratios.
- C3: Concepts and Computation With Decimal Fractions: The operations of addition, subtraction, multiplication and division are applied to decimal fractions. Also included is the recognition of equivalent forms of decimals using percents and common factors.
- P1: Properties of Numbers: Place value and ordering of numbers. (Whole numbers and decimal fractions.)
- P2: Number Expressions and Factors: Includes scientific notation (powers), number divisibility, prime factors, multiples and divisions.
- D1: Recognition of Terms and Symbols: integer, rational prime, odd and even numbers, ratio, sets, square root, order relations.
- G1: Recognition of Geometric Properties: Names for shapes; perimeter, area, altitude, diameter, parallel and other commonly used geometric terms.
- G2: Applications of Geometric Properties: Using a basic knowledge of area, perimeter, volume and other properties of geometric figures, this knowledge is applied to a given situation. Computation is often required.
- A1: Knowledge of Algebraic Expressions: Substitution and translation of verbal statements into algebraic symbolism.
- Algebraic Applications: Algebraic, symbolism is applied to several situations in determining solutions to equations.
 - M1: <u>Using Measurement Systems</u>: Knowledge of both the customary (English) and metric systems is applied to common situations. The use of the monetary system is included. Some problems require computation.
 - I1: Interpreting Graphs, Maps and Pictures: Picture graphs and other presentation of data are to be interpreted and conclusions are drawn.
 - PS1: Basic Problem Solving: Verbally stated problems require a direct translation into a solution involving only arithmetic computation.
- PS2: Patterns, Logic and Advanced Problem Solving: The recognition of a number pattern, drawing conclusions, and more advanced problem situations.
- MM1: Metric Measurement: Recognition of definitions and applications of the metric system of measurement.

SEVENTEEN-YEAR-OLD CLUSTERS (15)

- C1: Computation with Whole Numbers: Basic facts and addition, subtraction, multiplication, division and taking square roots.
- C2: The Fraction, Concept and Computation with Common Fractions: The concepts of ratio and equivalent fractions; addition, subtraction, multiplication and division with common fractions.
- C3: Computation with Decimals: Addition, subtraction, multiplication and division with decimals; conversion of decimals to percents and common fractions.
- P1: Properties of Numbers: Deals with odd and even numbers, positive and negative numbers, rational numbers and real numbers; also deals with factors, exponents and properties of number systems.
- G1: Recognition of Geometric Figures and Relations between Figures:

 Recognition of angles, polygons, ellipses, and parabola; also included are congruence and similarity relations for triangles.
- G2: Computing Perimeters, Areas and Volumes: Basic knowledge of area, perimeter, volume and other properties of geometric figures applied to specific situations.
- Al: Algebraic Expressions: Involves the knowledge necessary to manipulate algebraic expressions and to solve equations.
- A2: Applications of Algebra: The methods of algebra are used in situations requiring the solutions of algebraic equations.
- I1: <u>Interpreting Graphs, Tables and Maps</u>: Picture graphs and other representations of data are presented for interpretation and determination of accurate conclusions.
- PS1: Basic Problem Solving: Verbally stated problems that can be translated into equation form and then solved by means of simple arithmetic computations.
- PS2: Advanced Problems Solving: Recognition and use of the heuristics of problem solving and applying these to problem situations.
- M1: Measurement Systems: Use of common units of measurement. The great majority of exercises (six out of seven) deal with a basic knowledge of the metric system.
- SP: Statistics and Probability: Deals with basic notions of the probability of an event; also deals with the concepts of mean, mode and median.
- S1: Sets: Exercises relate to the general concepts of sets and subsets as well as basic operations on sets.
- T1: Trigonometry: Deals with basic knowledge and applications of the sine, cosine, tangent and cotangent functions.

3.2 Student Performance by Content Cluster

Table 3.1 lists percent scores for each cluster by student age for state, Bloomington and similar district students. The asterick * indicates a difference which is significant (not possibly due to chance in 95/100 cases). 13-year-old similar district data was not available.

Summary of Performance by Cluster - Nine-Year-Old

When Bloomington nine-year-olds are compared to state nine-year-olds, they equal or surpass the state nine-year-olds in 100% of the cluster categories. They significantly outperform their peers on 60% of the categories and overall perform significantly better than their nine-year-old peers.

Summary of Performance by Cluster - Thirteen-Year-Old

When Bloomington thirteen-year-olds are compared to state thirteen-year-olds, they equal or surpass the state thirteen-year-olds in all but one or 93% of the cluster categories. They significantly outperform their peers in 10 of the 15 clusters or 67% of the categories. Overall they perform significantly better than their thirteen-year-old state peers.

Summary of Performance by Cluster - Seventeen-Year-Old

When Bloomington seventeen-year-olds are compared to state seventeen-year-olds they equal or surpass the state seventeen-year-olds in all but three or 80% of the cluster categories. They significantly outperform their peers in 5 of the 16 or 31% of the clusters and overall equal the performance of their seventeen-year-old state peers.

All Students

Bloomington students had commendable performance overall in the clusters of mathematics content.

3.3 Bloomington performance in clusters of mathematics content in contrast to characteristics of pupils.

A pupil questionnaire was answered by pupil's participating in the assessment. Five student characteristics from this questionnaire were chosen for analysis.

• The student characteristics and their respective questionnaire items were: ,

GRADE Student participants were defined by age and from different grades. Hypothesis: Higher grade students should perform better because of more instruction.

1. I am in grade 06 08

SEX Performance of boys and girls has interest. Hypothesis: Boys will outperform girls.

2. I am a Oboy Girl

PARENTAL SCHOOL DISCUSSIONS

Parent discussion of school may influence achievement.

Hypothesis: If more parental discussion-then higher achievement.

- 6. How often do you and your parents talk about your school work and school activities?

 (Fill in only one circle.)
 - Never or hardly ever
 - 6 Once or twice a month
 - Once or twice a week
 - @ Just about every, day

STUDENT ATTITUDE TOWARD MATHEMATICS

Mathematics may be liked as a subject. Hypothesis: Students who like mathematics will have higher performance or higher performing students will like mathematics.

- 24. Compared to the other subjects you have studied in school, which of the following statements best describes your feelings about math? (Fill in only one circle.)
 - Math is my least favorite subject.
 - 6 Meth is not included among my favorite subjects.
 - @Math is included among my favorite subjects.
 - Math is my most favorite subject.

SOCIO-ECONOMIC STATUS

Employment level of parents reflects the socio-economic status of the student. Hypothesis: Higher socio-economic level students will show higher achievement.

5. How much school did your father and mother complete? (Fill in only one circle for each parent.)

Father A.	Mother Did not complete the 8th grade Completed the 8th grade but did not go to high school Went to high school but did not graduate from high school Graduated from high school Some education after graduation from high school Graduated from college Has an advanced degree (Masters or Doctorate)
Н. Ъ	h I don't know.

From the list to the right, pick the type of work which comes closest to your father's main job, and fill in the circle with the corresponding letter in the column headed "Father." Then pick the type of work which comes closest to your mother's main job, and fill in the circle with the corresponding letter in the column headed "Mother."

Please fill in only one circle in each column. If your father or mother has more than one job, fill in the circle with the letter corresponding to his or her MAIN job at this time.

|--|

- SEMI-SKILLED WORKER: factory worker, farm worker, bus driver, truck driver, gardener, mine worker, waiter or waitress, gas station attendant, cook, maid, taxi driver, laborer, custodian
- SKILLED CRAFTSMAN OR FOREMAN: carpenter, mechanic, plumber, electrician, policeman, draftsman, technician, barber or beautician, seamstress, practical nurse
- © OFFICE OR SALES CLERK: bank or store clerk, bookkeeper, mail clerk, office worker, secretary, telephone operator, mailman
- @ PROFESSIONAL: teacher, doctor, engineer, lawyer, social worker, public accountant, musician, dentist, writer, registered nurse, military
- MÁNAGER OR OWNER: farm owner or operator, business owner, store or office manager, banker, government official, administrator, real estate or insurance agent, or other sales persons
- ① HOMEMAKER (Stays at home)
- 6 DECEASED
- i I don't know.

Results for each age group are presented in comprehensive charts with performance in each cluster compared to student characteristics in appendix 3.1, 3.2 and 3.3. Results by age groups indicate the following:

NINE-YEAR-OLD

Most of the nine-year-olds: selected for assessment were fourth graders (407-Grade 4, 142-Grade 3). Bloomington nine-year-olds in grade four significantly outperformed their nine-year-old counterparts in grade three on all clusters, averaging a 12% gain and gaining as much as 20% in computation skills involving whole numbers.

Girls (271) and boys (276) were numerically about equal in the nine-year-old sample. Girls perform better in using mathematical symbols and sets. They also scored significantly better in recognizing simple geometric properties. However, boys do better in application of geometric properties. Boys outperform girls in the area of measurement. Overall the boy and girl performance levels are nearly equal.

Most Bloomington nine-year-olds in the sample (365) feel mathematics is their most favorable subject. Those students who consider mathematics their favorite subject achieve significantly greater success than those who do not consider mathematics one of their favorite subjects.

The largest number of students in the sample were classed as middle socio-economic class (280) as contrasted with high (192) and low (34). Achievement was significantly better overall and in 100% of the individual analysis categories for students in middle or high socio-economic status.

TABLE 3.1
CHARACTERISTICS OF BLOOMINGTON 9-YEAR-OLDS (N=550)

		• 👂 .
	I NUMBER	PERCENTAGE

⁽Percentages do not always total to 100 per cent, due to students not responding to the question.)

The larger group of the sample were eighth graders (679) but some were in seventh grade (143). Bloomington thirteen-year-olds who are eighth graders consistently outperform thirteen-year-olds who are seventh graders. Both groups outperform their state peers.

Approximately equal numbers of boys (413) and girls (405) took the tests. Bloomington boy and girl performances were nearly equal and both significantly exceeded their respective state levels.

Many thirteen-year-olds (368) listed mathematics as their favorite subject while slightly fewer saw it as not among their favorite (338) and some as their least favorite (117).

Students who listed mathematics as their favorite subject outperformed students who listed mathematics as their least favorite subject by a margin of 12% to 23% in each cluster.

The largest group of those students tested (492) were classed as middle socio-economic status as contrasted with high (265) and low (63). Students with a high socio-economic background outperformed students with a low socio-economic background by an average of 12% in each cluster.

TABLE 3.2
CHARACTERISTICS OF BLOOMINGTON 13-YEAR-OLDS (N=826)

(Percentages do not always tatal to 100 per cent, due to students not responding to the question.)

SEVENTEEN-YEAR-OLD

The largest group of the sample were eleventh graders (522) but some were tenth graders (24) and twelfth graders (96). Bloomington twelfth grade students tested outperformed eleventh grade students and both twelfth and eleventh grade students outperformed Bloomington 17-year-olds.

Approximately equal numbers of 17-year-old boys and girls took the tests. Bloomington boy and girl performances were nearly equal. Neither boys nor girls from Bloomington have performance significantly different from their respective state performance levels.

Most 17-year-old students tested listed mathematics as not among their favorite subjects. Students listing mathematics as their favorite outperformed those listing it as their least favorite (40.00 - 68.38).

The largest group of 17-year-old students tested (280) were classed as middle socio-economic status (S.E.S.) as contrasted with high (192) and low (34). Students with high socio-economic classification outperformed students with low socio-economic classification by an average of 13% overall.

3 -	63	9.8

3.4 Summary of Bloomington Performance

The most successful Bloomington mathematics student is either a boy or girl whose parents discuss school work at home. This boy or girl likes mathematics and has continued to take mathematics in high school.

The least successful Bloomington mathematics student is a boy or girl who almost never discusses school work at home, who has had only the minimum account of mathematics, who doesn't like math and comes from a low socio-economic classification.

A Bloomington 9 or 13-year-old will likely be found to have better mathematics understanding and skills than a 9 or 13-year-old from most any other place. A Bloomington 17-year-old is likely to have about the same mathematics skills and knowledge as a 17-year-old from any other place.

ANALYSIS OF BLOOMINGTON PERFORMANCE BY ITEMS IN COMPARISON WITH MINNESOTA AND THE NATION

4.1 Introduction

This chapter contains descriptions of the contrasts in Bloomington performance with mathematics performance of analogous groups in Minnesota and the nation. The use of national assessment items within the Minnesota assessment made these comparisons possible.

The major purpose of this chapter is to compare Bloomington students mathematics performance with that of students in Minnesota and the nation. Complete tables of these comparisons are in appendix 4.1, 4.2 and 4.3.

4.2 Performance by item for 9, 13 and 17-year-olds -

Table 4.1 presents Bloomington 9, 13 and 17-year-old performance on comparison items. Number and percentage of objectives are listed where Bloomington performance was significantly above, significantly below, or had no difference in contrast to the comparison group. Significance here refers to the criteria that such difference would not occur by chance in 95 of 100 cases.

Bloomington Performance by % of items

	, 5		,	Significantly Above	No Difference	,	Significantly Below
	Blookington	vs Minnesota	9 13 17	38.7 38.8 7.3	58.1 57.4 83.6	· .	3.2 3.7 9.1
	Bloomington	vs Minnesota Suburbs	9 13 17	. 29.0 24.0 0.0	61.3 , 70.3 , 81.8	•	9.7. 5.5 . 18.2
	Bloomington	vs U.S.	9 13 17	71.0 68.5 29.1	22.5 29.6 65.4	,	6.5 1.8 5.5
,	Bloomington	vs U.S. Suburbs	9 13 17	29.0 29.6 .14.6	64.5 68.5 83.6	· ·	6.5 1.8 1.8

4.3 Summary

Bloomington 9 and 13-year-olds performed as well or better than their state, state suburb, nation and nation suburb counterparts on over 90% of the comparison items.

Bloomington 13-year-olds outperformed all groups in items dealing with scientific notation, solving simple algebraic equations and inequalities, simple probability, graphic linear equations and geometric relations. In their areas of their poorest performance, use of terminology and use of symbols, the performance of Bloomington 13-year-olds was still equal to that of their statewide peers.

Bloomington 17-year-olds performed as well or better than their state, state suburb, nation and nation suburb counterparts on over 80% of the comparison items. Bloomington 17-year-olds did not significantly outperform their peers in other Minnesota suburbs.

CHAPTER V

ANALYSIS OF GROWTH OF BLOOMINGTON STUDENT PERFORMANCE
BY SIMILAR TEST ITEM RESULTS BETWEEN AGES 9, 13 and
17-YEAR-OLDS

5.1 Introduction

To measure the growth in mathematics skills and understanding between the ages of 9, 13 and 17, some identical items were used in testing each age level. Some of these "overlap" items were used at all three levels. Overlap performance is presented here in tables and verbal summaries in three groupings:

- (1) 9, 13 and 17-year-olds overlap
- (2) 9 and 13-year-olds overlap
- (3) 13 and 17-year-olds. overlap

5.2 Overlap performance

Table 5.1 presents the overlap performance of 9, 13 and 17-year-old students. Bloomington students improve performance with increased age in every one of the 15 items. The largest gains in performance are in multiplication, division, word problems, geometry and algebra. Phese are areas attended to by instruction. Bloomington 9, 13 and 17-year-old performance growth follows a pattern similar to that of state students. However, Bloomington students often perform higher than the state students as 9 and 13-year-olds but at 17-year-olds perform lower.

Table 5.2 presents overlap performance of 9 and 13-year-old students. Nine-year-old students and thirteen-year-old students were tested on 17 identical items encompassing each of the 10 categories that were analyzed. On each of these items gains ranged from 4.1% on place value (students were at the 90% level) to 57% on word problem solutions, averaging overall a 28% gain.

Table 5.3 presents the overlap performance of 13 and 17-year-old students on 61 items. Bloomington students show growth between 13 and 17-year-old performance on nearly every item tested. Large gains in performance by 17-year-olds are in items using algebra skills and geometry concepts. On items testing knowledge of metrics, 13-year-olds outperform 17-year-olds. 13-year-olds also show superior performance on fraction problems; including multiplications of fractions and fractions of a circle.

· Multiplications of fractions and fractions of a circle

Performance growth between 13 and 17-year-olds for Bloomington students does not keep pace. Bloomington 13-year-olds are seen exceeding state 13-year-olds performance. Bloomington 17-year-olds are seen just matching it or slightly behind.

5.3 Summary

Growth in mathematics knowledge and skills is evident in the analysis of overlap item performance.

The nine-year-old difficulty with subtraction was completely eliminated by age 13 as evidenced by a 59.1% gain in accuracy.

Gains are found in every area with these exceptions:

- Seventeen-year-olds exhibit less knowledge of metrics than thirteen-year-olds.
- Seventeen-year-olds demonstrate less facility with multiplication of fractions and identifying fractional parts.

OPERATING PROCEDURES FOR DISTRICT EVALUATION ADVISORY COMMITTEE

I. RELATIONSHIPS

This is an advisory committee at the district level in the area of district evaluation for public reporting. In this relationship, the committee makes recommendations for policy and procedures & recommends appropriate task forces to complete assigned functions.

II. MEMBERSHIP

Total membership should be such that the total committee is less than 15.

- A. The membership of the DEAC shall comprise the following:
 - 1 District Evaluation Representative
 - 2 Elementary Principals
 - 2 Secondary Principals
 - 4 Elementary Teachers
 - 4 Secondary Teachers
 - 1 Special Education Representative
- B. Appointment to Membership
 - 1. Principal members of the DEAC shall be appointed by their respective Assistant Superintendent.
 - 2. The Special Education representative shall be recommended by the Director of Special Education.
 - 3. Teacher members of the committee shall be
 - 2 Elementary Instructional Advisory Committee members
 - 2 Secondary Instructional Advisory Committee members
 - 2 District Curriculum Advisory Committee members
 - 1 .- Elementary teacher at large
 - 1 Secondary teacher at large

Recommendation should be made by April. Appointment should be made by the end of May.

- 4. Teacher members of the DEAC shall be appointed by their respective Assistant Superintendent from a list of recommended nominees.
- C. Term of Office

The term of office for each member shall be three years with approximately 1/3 of the members replaced each year.

- D. Leadership
 - 1. The District Evaluation representative shall chair the regular meetings of DEAC.
 - 2. The District Evaluation representative shall appoint a committee member to assume the leadership role in cases of absence.

III. | FUNCTIONS

A. Review, evaluate and recommend revision of district Position Statement on evaluation.

B. Review, evaluate and recommend district-wide curriculum evaluation areas and develop procedures for their conduct.

IV. MEETINGS

The regular meeting of the DEAC shall be held on the third Wednesday of designated months of the school year. Meeting hours shall be from 8:00 a.m. to 11:30 a.m. There shall be approximately 6 meetings per year. Special meetings shall be called at the discretion of the chairperson.

Necessary teacher substitutes shall be budgeted through the District Evaluation budget.

V. REPORTING

A copy of the minutes of each meeting of DEAC shall be distributed to:

-The superintendent of schools

-Assistant superintendents

-District .directors

-The chairpersons of District & Division Administrative Advisory Councils for members of these councils

-The chairpersons of the Elementary & Secondary Instructional Advisory Committees for members of those committees

-The chairperson of the District Curriculum Advisory Committee for distribution to members of that committee.

⁽¹⁾ Represents total for each objective, i.e. IAl (which-includes 1-4 and 2-4).

Represents significant difference.

92

⁽²⁾ Represents totals for each item, i.e., 1-4 (Package #1, Item #4) and 2-4 (Package #2, Item #4)

Potential Strenght

NEEDS AND STRENGTHS AS DETERMINED BY CRITERION AND COMPARATIVE MEASURES

ΚEΥ

Strength

Represents totals for each objective, i.e. IAl (which includes 1-5, and 2-4, and 3-4).

Represents totals for each item, i.e., 1-5 (Package #1, Item #5), and 2-4 (Package #2, Item #4), and (Package #3, Item #4).

Represents significant difference.
